

VAPING & THE ENVIRONMENT

Did you know?

- Each disposable vape contains 0.15g of lithium, a metal in high demand
- 1.3 million single-use vapes are thrown away every week or 5.4 million per month
- About 10 tonnes of lithium is ending up in landfills per year from disposable vapes
- Incorrect disposal of these items can potentially release, plastic, electrical and hazardous chemical waste into the environment
- Incorrect battery disposal can cause fire and health and safety risks at landfill sites and for waste collection teams
- Disposable vapes should be recycled at your local household recycling centre.
